Executive Summary

Background

Understanding the implications of COVID-19 infection during pregnancy may help public health practitioners to support expectant parents, and may guide obstetric care for patients with COVID-19.

This rapid review was produced to support public health decision makers' response to the coronavirus disease 2019 (COVID-19) pandemic. This review seeks to identify, appraise, and summarize emerging research evidence to support evidence-informed decision making.

This rapid review is based on the most recent research evidence available at the time of release. A previous version was completed on May 15, 2020. This updated version includes evidence available up to August 17, 2020.

In this rapid evidence review, we answer the question: **Is there an increased risk of adverse maternal or fetal outcomes in women infected with COVID-19 during pregnancy?**

What has changed in this version?

- Many more syntheses are emerging in the recently found evidence. Only syntheses published since April 2020, that included quality appraisal of included studies, were added to this update.
- One meta-analysis showed no difference in the rate of pre-term birth or low birthweight among pregnant women with COVID-19 infection compared to non-infected women.

Key Points

- **Maternal outcomes:** Overall, the available evidence shows a low risk of adverse maternal outcomes associated with COVID-19 infection, although most studies do not compare rates to those of non-infected women. The overall certainty of this evidence related to maternal outcomes is very low (GRADE), and findings are very likely to change as more evidence accumulates.
- **Labour and delivery outcomes:** A meta-analysis showed no difference in the rate of pre-term birth among women infected with COVID-19 infection compared to non-infected women. Syntheses report rates of pre-term birth between 20-39% of cases, and a rate for cesarean deliveries among women with COVID-19 of between 48-96% (although the clinical indications for cesarean in these cases are not well described), and the limited available evidence suggests that vaginal delivery can be safe. The overall certainty of this evidence related to labour and delivery outcomes is very low (GRADE), and findings are very likely to change as more evidence accumulates.
- **Fetal and neonatal outcomes:** A meta-analysis found no difference in rates of low birthweight for infected versus non-infected pregnant women. Rates of fetal death and stillbirth are between <1-10%. In syntheses reporting on neonatal COVID-19 infection, between 0-7% of neonates were infected, although it is not known if they were infected

before or during delivery, or after delivery through exposure to infected health care workers. There is no definitive evidence of vertical transmission. The overall certainty of this evidence related to fetal and neonatal outcomes is very low (GRADE), and findings are very likely to change as more evidence accumulates.

Overview of Evidence and Knowledge Gaps

- This rapid review has focused on syntheses. Much of the available evidence comes from case reports and case series, which have an inherently high risk of bias due to the likelihood of selection bias (i.e., those who are included in the study are fundamentally different from those who were not in the study) and lack of a comparison group needed to properly identify elevated rates. Only one synthesis meta-analyzed outcomes for pregnant women with COVID-19 infection versus non-infected pregnant women, based on the results of three studies.
- Although several syntheses exist, there is a large amount of overlap of single studies within the reviews. For example, the same eight observed cases of maternal death were reported in two syntheses; the same neonatal deaths were reported in more than one review. Similarly, the high rate of cesarean delivery may be overestimated due to the same deliveries being reported in multiple reviews. Some syntheses made efforts to eliminate duplicated cases across studies.
- There is a large number of syntheses available at the time of this update – our search located 52 completed syntheses and 41 in progress. Of the available syntheses, this update included seven, published since April 2020 and that undertook quality appraisal of included primary studies. The majority of available syntheses are of low quality, with many lacking methodological details as well as not appraising the quality of included studies. More, rigorous, primary studies are needed, and as they become available, global collaboration is needed to produce a small number of rigorous systematic reviews and meta-analyses.
- Evidence on maternal, fetal and neonate outcomes among women with COVID-19 infection is lacking, particularly for women who are infected in the first and second trimesters.
- It is not known whether COVID-19 infection resulted in clinical indication for cesarean delivery or whether clinician preference determined the method of delivery.
- It is not known whether the reported rate of cesarean delivery or pre-term delivery for women with COVID-19 infection is significantly higher than usual at these locations.

Methods

Research Question

Is there an increased risk of adverse maternal or fetal outcomes in women infected with COVID-19 during pregnancy?

Search

On May 7, 2020, and again on August 17, 2020, the following databases were searched:

- Pubmed's curated COVID-19 literature hub: [LitCovid](#)
- [Trip Medical Database](#)
- World Health Organization's [Global literature on coronavirus disease](#)
- Joanna Briggs Institute [COVID-19 Special Collection](#)
- [COVID-19 Evidence Alerts](#) from McMaster PLUS™
- [Public Health +](#)
- [COVID-19 Living Overview of the Evidence \(L·OVE\)](#)
- [McMaster +](#)
- Cochrane [COVID-19 Special Collections](#)
- Cochrane Rapid Reviews [Question Bank](#)
- Oxford [COVID-19 Evidence Service](#)
- Oxford COVID-19 Evidence Service: [Current Questions Under Review](#)
- Guidelines International Network ([GIN](#))
- [CovidReview](#)
- [Prospero Registry of Systematic Reviews](#)
- NCCMT [COVID-19 Rapid Evidence Reviews](#)
- [MedRxiv preprint server](#)
- [PubMed](#) database

A copy of the search strategy is available on request.

What has changed in the methods for this version?

Only syntheses published since April 2020, that included quality appraisal of included studies, were added to this update. Single studies previously included were removed in this update, given the large number of syntheses now available.

Study Selection Criteria

The search results were first screened for recent guidelines and syntheses. English- and French-language, peer-reviewed sources and sources published ahead-of-print before peer review were included. In the update, only recent syntheses that included quality appraisal of included studies were added.

	Inclusion Criteria	Exclusion Criteria
Population	Pregnant women	
Intervention	COVID-19 infection	
Comparisons		
Outcomes	Maternal outcomes including: Mortality; Clinical features and symptoms Fetal/Neonatal outcomes including: Miscarriage/stillbirth/mortality; Birthweight; COVID-19 infection; Vertical transmission Labour and delivery outcomes including: Preterm; Cesarean.	

Data Extraction and Synthesis

Data relevant to the research question, such as study design, setting, location, population characteristics, interventions or exposure and outcomes were extracted when reported. We synthesized the results narratively due to the variation in methodology and outcomes for the included studies.

Appraisal of Evidence Quality

We evaluated the quality of included evidence using critical appraisal tools as indicated by the study design below. Quality assessment was completed by one reviewer and verified by a second reviewer. Conflicts were resolved through discussion.

Study Design

Synthesis

Critical Appraisal Tool

Assessing the Methodological Quality of Systematic Reviews (AMSTAR)

[AMSTAR 1 Tool](#)

Completed quality assessments for each included study are available on request.

The Grading of Recommendations, Assessment, Development and Evaluations ([GRADE](#)) approach was used to assess the certainty in the findings based on eight key domains.

In the GRADE approach to quality of evidence, **observational studies**, as included in this review, provide **low quality** evidence, and this assessment can be further reduced based on other domains:

- High risk of bias
- Inconsistency in effects
- Indirectness of interventions/outcomes
- Imprecision in effect estimate
- Publication bias

and can be upgraded based on:

- Large effect
- Dose-response relationship
- Accounting for confounding.

The overall certainty in the evidence for each outcome was determined taking the characteristics of the available evidence into account (observational studies, some not peer-reviewed, unaccounted-for potential confounding factors, imprecise estimates, lack of valid comparison groups for most studies). A judgement of 'overall certainty is low (or very low)' means that the findings are likely or very likely to change as more evidence accumulates.

Findings

Summary of Evidence Quality

This version adds seven new completed syntheses and removes three single studies, for a total of 18 publications included in this review. Case reports and case series were excluded from this update, due to the risk of bias inherent in these study designs and the availability of more rigorous evidence.

Outcome	Evidence found		Overall certainty in evidence
Maternal mortality	Completed syntheses	3	Very low
Maternal clinical characteristics	Completed syntheses	7	Very low
Fetal/neonatal mortality	Completed syntheses	10	Very low
Birthweight	Completed syntheses	2	Low
Newborn COVID-19 infection	Completed syntheses	6	Low
Vertical transmission	Completed syntheses	5	Very low
Pre-term birth	Completed syntheses	6	Low
Cesarean	Completed syntheses	11	Very low

Warning

Given the need to make emerging COVID-19 evidence quickly available, many emerging studies have not been peer reviewed. As such, we advise caution when using and interpreting the evidence included in this rapid review. We have provided an assessment of the overall certainty of the evidence and a summary of the quality of the evidence as low, moderate, or high to support the process of decision making. Where possible, make decisions using the highest quality evidence available.

Table 1: Syntheses

Study designs included case series, case reports, and retrospective studies.</p>	<p>39% had preterm birth; 96% had cesarean delivery with unclear indications. No evidence of vertical transmission. 1 fetal death occurred in a critically ill patient. Clinical outcome has been generally favorable for both mothers and neonates.</p>	<p>Moderate</p>	<p>Low to moderate</p>
<p>Parazzini, F., Bortolus, R., Mauri, P.A., Favilli, A., Gerli, S. and Ferrazzi, E. (2020). Delivery in pregnant women infected with SARS-CoV-2: A fast review. <i>International Journal of Gynecology & Obstetrics</i>, 150(1), 41–46.</p>	<p>Apr 10, 2020 (Search completed Mar 31, 2020)</p>	<p>P: pregnant women and their fetuses/neonates E: COVID-19 infection C: no comparator O: maternal COVID-19 symptoms, pregnancy complications, neonatal COVID-19 symptoms, neonatal health status, delivery timing and type, vertical transmission</p>	<p>Rapid review of 13 studies from around the world, published between 1 January to 31 March 2020, of clinical maternal characteristics, mode of delivery and neonatal outcomes for 64 pregnant women infected with COVID-19. Study designs included case reports and retrospective clinical series.</p>	<p>Pneumonia was present in 80.3% women, oxygen support was needed by 82.9%, and 6.5% were admitted to a critical care unit (among limited cases for which the information was available). 39.6% had preterm birth; 48.4% had caesarian delivery due to worsening of maternal conditions. In all reported cases the 5-minute Apgar score was greater than 7 and generally 9 or 10. Zero or low rate of vertical or peripartum transmission through cesarean delivery; no data available for vaginal delivery. Risk of transmission during breastfeeding is unknown. Overall, risk of adverse maternal and fetal outcomes is low.</p>	<p>Moderate</p>	<p>Not reported</p>

<p>Zaigham, M., & Andersson, O. (2020). Maternal and perinatal outcomes with COVID-19: A systematic review of 108 pregnancies. <i>Acta Obstetrica Et Gynecologica Scandinavica</i>, 99(7), 823–829.</p>	<p>Apr 6, 2020 (Search completed Apr 4, 2020)</p>	<p>P: pregnant women and their fetuses/neonates E: COVID-19 infection C: no comparator O: maternal COVID-19 symptoms, pregnancy complications, neonatal COVID-19 symptoms, neonatal health status, delivery timing and type, vertical transmission</p>	<p>Systematic review of 18 studies from around the world, published between 8 December 2019 and 4 April 2020, of clinical manifestations and maternal and perinatal outcomes for 108 pregnant women with lab-confirmed COVID-19 infection. Study designs included case reports and case series.</p>	<p>68% presented with a fever at admission. 91% had cesarean delivery. The majority of mothers were discharged without any major complications. However, severe maternal morbidity as a result of COVID-19 and perinatal deaths were reported, with 3% of women requiring admission to maternal ICU, and 1 case of perinatal death. No clear evidence for vertical transmission.</p>	<p>Moderate</p>	<p>Low</p>

Table 2: In-progress Syntheses

Title	Anticipated Release Date	Description of Document
Previously reported evidence		
Bahri, N., Dashti, S., Najafi, T.F., & Tohidinik, H.R. (2020). Assessment of the possibility of vertical transmission of COVID-19: a systematic review and meta-analysis protocol . <i>PROSPERO CRD42020173886</i> .	Mar 1, 2021	This review will assess the possibility of vertical transmission of COVID.
Fen, L.Y., Lei, G.X., Han, N.C., Mei, Y.N.P., & Amin, Z. (2020). A systematic review of neonates and COVID-19 . <i>PROSPERO CRD42020183500</i> .	Dec 31, 2020	This review will address four questions: 1) What are the maternal and neonatal serological results (i.e. IgM and IgG) in reported COVID-19 pregnancies; 2) What are the immunological profiles of mothers and neonates in reported COVID-19 pregnancies; 3) What is the effect of gestational age at maternal COVID-19 infection on neonatal outcomes and 4) What are the neonatal outcomes of perinatally acquired infection compared to postnatally acquired infection?
Foratori-Junior, G.A., Mosquim, V., & de Carvalho Sales-Peres, S.H. (2020). COVID-19 and its relation with pregnancy and neonates: a systematic review . <i>PROSPERO CRD42020177354</i> .	Sep 24, 2020	This review will look to synthesize evidence on the symptoms of COVID in pregnant women and in their newborn children as well as the impacts on delivery and the possibility of vertical transmission.
Ramos, M. (2020). COVID-19 in pregnant women: a systematic review . <i>PROSPERO CRD42020179843</i> .	May 31, 2020	The research question for this review is, “What evidence is available about COVID-19 in pregnant women?” The primary outcomes are hospitalization, mortality, medical complications and readmission and secondary outcomes include clinical management and delivery arrangements.
Poon, L., Yang, H., del Mar Gil, M., & Juan, J. (2020). Maternal, fetal and neonatal characteristics and clinical outcomes in cases of COVID-19 infection during pregnancy: a systematic review . <i>PROSPERO CRD42020181557</i> .	May 25, 2020	The research question looks to answer, “What is the effect of SARS-CoV-2 infection (COVID-19 disease) in pregnancy, mother, fetus and newborn”.
Novoa, R., Muñoz, W.O., Melendez, P.A.L., & Laveriano, W.V. (2020). Maternal clinical characteristics and perinatal outcomes of pregnant women infected by coronavirus (COVID-19). A systematic review . <i>PROSPERO CRD42020176534</i> .	Apr 30, 2020	This review will look to answer two questions: 1) What are the clinical characteristics of COVID-19 infection in pregnant women; and 2) What are the perinatal outcomes of COVID-19 infection in pregnant women?
