## Résumé

### Contexte

Alors que les États continuent de lutter contre la maladie à coronavirus 2019 (COVID-19), y compris contre de récents variants préoccupants, le respect des mesures de santé publique recommandées, comme la distanciation physique, l'hygiène des mains et le port du masque, sera déterminant pour réduire le fardeau de la maladie à coronavirus 2019 (COVID-19) et prévenir sa propagation afin de protéger les plus vulnérables. Un sujet de plus en plus préoccupant est le relâchement du respect des individus envers ces mesures. Ce relâchement peut être en partie attribué à la confusion et au manque de clarté entourant les changements dans les recommandations, alors que plusieurs mesures sont levées pour être ensuite réintroduites. Pour aider à contrôler la propagation, il faut une communication efficace de la part des responsables gouvernementaux, médecins, des organisations de santé publique locales et d'autres leaders de la communauté.

Cette revue rapide a été produite pour soutenir la réponse de l'Agence de la santé publique du Canada à la pandémie de coronavirus 2019 (COVID-19). Cet revue vise à recenser, évaluer et résumer les nouvelles données de recherche à l'appui de la prise de décision fondée sur des données probantes.

Cette revue se fonde sur les données probantes issues de la recherche les plus récentes auxquelles il était possible d'avoir accès au moment de sa publication. Une version précédente a été terminée le 8 octobre 2020. Cette version mise à jour inclut les données probantes disponibles au 12 février 2021 pour répondre à la question suivante : **Quelles sont les meilleures pratiques en matière de communication des risques et de stratégies visant à réduire les comportements à risques?**

### Qu'est-ce qui a changé dans cette version?

- Quatre nouvelles synthèses portant sur des domaines autres que la COVID-19 ont été ajoutées. La pertinence de ces résultats pour le contexte de la COVID-19 est inconnue.
- De nouvelles données probantes spécifiques à la COVID-19 sont apparues dans cette mise à jour, tirées de six nouvelles études uniques. Ces études offrent davantage de précisions quant aux caractéristiques des porte-parole efficaces, comme des médecins pour certaines populations.
- Les principaux éléments demeurent cohérents.

### Point Clés

- Dans plusieurs domaines, la littérature portant sur la communication des risques souligne l'importance de messages clairs, répétés et axés sur l'action, provenant d'un leader en qui les gens ont confiance (p. ex., un ou une leader de la communauté, un professionnel ou une professionnelle de la santé publique crédible, etc.). Le degré de certitude des données probantes est modéré (GRADE).

- On peut renforcer la confiance envers le message et la personne qui le livre en répondant à l'incertitude et en reconnaissant que les recommandations ou les informations peuvent avoir changé et que des erreurs peuvent avoir été commises. Le degré de certitude des données probantes est faible (GRADE) et pourrait changer à mesure que de nouvelles données apparaîtront.
- Tant le message que le support de communication devraient être adaptés aux publics cibles. L'implication des parties prenantes est importante pour trouver le cadrage et le support les plus appropriés au message. Le degré de certitude des données probantes est modéré (GRADE).
- On a observé que la consommation des médias traditionnels entraînait une meilleure rétention des messages ainsi que l'expression d'opinions plus favorables à la gestion de crise des gouvernements. La communication sur la santé entre les pairs et les interventions multimédias intensives ont démontré leur efficacité pour influencer la modification de comportements à risque relativement aux virus. Des messages cadrés de façon positive et mettant l'accent sur une responsabilité collective ou sociale, comparativement à une approche individuelle, pourraient être plus efficaces. Toutefois, une synthèse et une étude n'ont démontré aucun effet du cadrage des messages sur les attitudes et les intentions en matière de vaccination. Le degré de certitude des données probantes est faible (GRADE) et pourrait changer à mesure que de nouvelles données apparaîtront.
- Les données probantes sont insuffisantes en ce qui concerne l'expérience des inégalités sociales et structurelles vécues par certaines populations, comme les communautés autochtones ou racialisées. Plus d'études sont nécessaires pour garantir que ces populations seront représentées dans la prise de décisions.
- En ce qui concerne l'expression du risque à l'aide de statistiques, les fréquences sont mieux comprises que les pourcentages, et le risque relatif est plus persuasif que le risque absolu ou le nombre de personnes à traiter. Le degré de certitude des données probantes est modéré (GRADE).

### Aperçu des données probantes et lacunes dans les connaissances

- On a observé que les médecins sont des porte-parole efficaces permettant d'améliorer les connaissances relatives à la COVID-19 chez certains segments de la population, dont les publics japonais et les personnes noires. De plus, le fait que des médecins soient de la même race/ethnicité que leur public est particulièrement efficace pour améliorer les connaissances des personnes noires. D'autres efforts de personnalisation (p. ex., reconnaître l'injustice et les difficultés économiques, ou répondre à la peur que le port du masque suscite de l'ostracisme ou du racisme) n'ont pas eu d'effets significatifs sur les connaissances ou les comportements de prévention.
- Les données probantes sont insuffisantes concernant la transmission de messages pour changer les comportements et améliorer l'adhésion aux pratiques de contrôle des infections. Les autres caractéristiques d'un leader de confiance, et une meilleure compréhension des traits de la meilleure personne pouvant livrer des messages à des publics cibles précis, sont des questions qui nécessitent davantage d'études.
- Les approches participatives en matière de communication des risques dans les pays à revenu faible ou intermédiaire sont les plus efficaces.

- La communication efficace au sujet des vaccins dépend de plusieurs facteurs, dont la perception du risque, mais les résultats de recherche sont contradictoires, selon une synthèse.
- La majorité des données proviennent d'études réalisées dans d'autres domaines (p. ex., au sujet d'épidémies antérieures, de la vaccination des enfants ou des comportements liés au tabac). Étant donné l'ampleur inégalée de la pandémie de COVID-19 ainsi que l'influence des réseaux sociaux aujourd'hui, les résultats antérieurs ne s'appliquent peut-être pas directement à la situation actuelle.
- Peu de données probantes portent sur les types de campagnes de marketing social qui démontrent un effet d'augmentation du dépistage. Plusieurs des études uniques qui explorent les répercussions de la communication des risques spécifique à la COVID-19 se limitent à une évaluation de la diffusion des informations dans les réseaux sociaux. Une évaluation continue des effets des campagnes de communication actuelles spécifiques à la COVID-19 sur les connaissances ainsi que sur les changements d'attitudes et de comportements aidera à éclairer les interventions de lutte contre la pandémie.

# Méthodologie

## Question de recherche :

Quelles sont les meilleures pratiques en matière de communication des risques et de stratégies visant à réduire les comportements à risques?

## Recherche

Les bases de données suivantes ont été fouillées le 12 février 2021 en utilisant les termes clés "risk communication", "behavioural science", "behavioral science", "social marketing", "social behaviour", "social behavior", "persuasive communication", "health communication". Cette recherche s'appuie sur la recherche précédente réalisée dans la première version de cette revue rapide :

- Pubmed's curated COVID-19 literature hub: [LitCovid](#)
- [Trip Medical Database](#)
- World Health Organization's [Global literature on coronavirus disease](#)
- [COVID-19 Evidence Alerts](#) from McMaster PLUS™
- [Public Health +](#)
- [COVID-19 Living Overview of the Evidence \(L·OVE\)](#)
- [McMaster Health Forum](#)
- [Prospero Registry of Systematic Reviews](#)
- [MedRxiv preprint server](#)
- [PsyArXiv preprint server](#)
- [MEDLINE database](#)
- [EMBASE database](#)
- NCCMT [COVID-19 Rapid Evidence Reviews](#)
- NCCDH [Equity-informed Responses to COVID-19](#)
- NCCEH [Environmental Health Resources for the COVID-19 Pandemic](#)
- NCCHPP [Public Health Ethics and COVID-19](#)
- NCCID [Disease Debrief](#)
- NCCIH [Updates on COVID-19](#)

## Critères de sélection des études

Les sources de langue anglaise et français évaluées par les pairs et les sources publiées avant l'impression et avant l'évaluation par les pairs ont également été incluses. Lorsqu'ils sont disponibles, les conclusions des synthèses et les guides de pratique clinique sont présentés en premier, car ils tiennent compte de l'ensemble des preuves disponibles et peuvent donc être appliqués largement aux populations et aux milieux.

En raison de la vaste littérature sur la communication des risques dans les contextes autres que celui de la COVID-19, seules des synthèses de cette littérature ont été incluses. Les études uniques relatives à la COVID-19 ont été incluses si aucune synthèse n'était disponible, ou si ces études uniques avaient été publiées après la date de la recherche réalisée dans les synthèses incluses. Les documents d'orientation spécifiques à la communication des risques durant la pandémie de COVID-19 et issus d'organisations réputées ont été considérés comme pertinents et inclus. Les sources de surveillance ont été exclues.

	Critères d'inclusion	Critères d'exclusion
<b>Population</b>	La population en général	
<b>Intervention</b>	Communication des risques, en santé publique et dans d'autres contextes	Prise de décision clinique, aide à la décision clinique
<b>Comparaison</b>	-	
<b>Résultats</b>	Modification des connaissances, des attitudes et des comportements	

## Extraction et synthèse des données

Pour les synthèses, les données sur la conception de l'étude, le cadre, l'emplacement, les caractéristiques de la population, les interventions ou l'exposition et les résultats ont été extraites au moment de la déclaration. Pour les documents d'orientation, les données sur l'administration, l'organisation, la date de publication et la nature de l'orientation ont été extraites au moment de la déclaration.

## Évaluation de la qualité des données probantes

Nous avons évalué la qualité des données probantes incluses en utilisant des outils d'évaluation critique, comme nous le décrivons ci-dessous. L'évaluation de la qualité a été réalisée par un examinateur et vérifiée par un deuxième examinateur. Les conflits ont été résolus par la discussion. Pour certaines des données probantes incluses, aucun outil approprié n'a été trouvé, ou l'équipe de revue n'avait pas l'expertise nécessaire pour évaluer leur qualité méthodologique. Les études pour lesquelles aucune évaluation de la qualité n'a été effectuée sont indiquées dans les tableaux de données.

Méthodologie de l'étude	Outils d'évaluation critique
Synthèse	Assessing the Methodological Quality of Systematic Reviews (AMSTAR) <a href="#">AMSTAR 1 Tool</a>
Étude transversale	Joanna Briggs Institute (JBI) <a href="#">Checklist for Analytical Cross-Sectional Studies</a>
Qualitative	Joanna Briggs Institute (JBI) <a href="#">Checklist for Qualitative Research</a>
Quasi expérimentale	Joanna Briggs Institute (JBI) <a href="#">Checklist for Quasi-Experimental Studies</a>
Essai clinique randomisé	Joanna Briggs Institute (JBI) <a href="#">Checklist for Randomized Controlled Trials</a>

Les évaluations de la qualité effectuées pour chaque étude incluse sont disponibles sur demande.

L'approche [GRADE](#) (Grading of Recommendations, Assessment, Development and Evaluations) a été utilisée pour évaluer la certitude des résultats sur la base de huit domaines clés (Schünemann *et al.*, 2013).

Selon l'approche GRADE en matière de qualité des données probantes, les **études observationnelles**, telles que celles incluses dans cette revue, fournissent des données probantes de **faible qualité**. Cette évaluation peut être réduite encore davantage en fonction d'autres domaines :

- un risque de biais élevé;
- l'incohérence des effets;
- le caractère indirect des interventions/résultats;
- des imprécisions dans l'estimation de l'effet;
- un biais de publication.

À l'inverse, elle peut être rehaussée sur la base des domaines suivants :

- un effet important;
- une relation dose-effet;
- une prise en compte des variables confusionnelles.

Pour chaque résultat, la certitude globale des données probantes a été déterminée en tenant compte des caractéristiques des données probantes dont on dispose (des études observationnelles, dont certaines n'ont pas été évaluées par les pairs, des variables confusionnelles potentielles qui n'ont pas été prises en compte, des essais et des protocoles d'essais différents, et une absence de groupes de comparaison valides). Un jugement selon lequel « la certitude globale est très faible » signifie que les résultats risquent fort de changer à mesure que de nouvelles données probantes apparaissent.

## Résultats

### Synthèse de la qualité des données probantes

Dans cette mise à jour, 4 nouvelles synthèses, 6 nouvelles études individuelles, et 1 nouvelle synthèse en cours ont été recensées, pour un total de 28 publications portant sur la question de recherche. La qualité des données probantes incluses dans cette revue se décrit comme suit :

Question(s) de recherche	Données probantes incluses	Certitude globale des données probantes	
Quelles sont les meilleures pratiques en matière de communication des risques et de stratégies visant à réduire les comportements à risques?	Synthèses terminées Études individuelles Synthèses en cours Études individuelles en cours Documents d'orientation	13 9 1 2 3	Modérée

### Attention

Comme il faut rendre rapidement disponibles les nouvelles données probantes sur la COVID-19, plusieurs études émergentes n'ont pas été révisées par des pairs. Pour cette raison, nous vous conseillons la prudence quand vous utilisez et interprétez les données probantes incluses dans cette revue rapide. Nous avons résumé la qualité des données probantes en la catégorisant comme faible, modérée ou élevée, afin de soutenir le processus de prise de décision. Lorsque c'est possible, nous vous recommandons de fonder vos décisions sur les données probantes de la plus haute qualité possible.

## Tableau 1 : Synthèses

Reference	Date Released	Description of Included Studies	Summary of Findings	Quality Rating: Synthesis	Quality Rating: Included Studies
<b>New evidence from other topical areas reported on March 12, 2021</b>					
Winograd, D. M., Fresquez, C. L., Egli, M., Peterson, E. K., Lombardi, A. R., Megale, A., ... McAndrew, L. M. (2021). <a href="#">Rapid Review of Virus Risk Communication Interventions: Directions for COVID-19.</a> <i>Patient Education and Counseling.</i> Epub ahead of print.	Jan 20, 2021 (search date not specified)	This rapid review included 31 single studies (14 randomized controlled trials) evaluating interventions for reducing the spread of viruses (HIV, Hepatitis B, influenza, H1N1, MERS, Zika) by changing individual cognitions or behaviours.	<p>There was no clear best intervention among peer health communication, intensive multimedia communication, and audio/visual interventions.</p> <p>Peer health communication, in which peers share knowledge and behaviour change approaches, showed the most consistent positive findings for changing cognitive risk perception related to viruses and behaviour change outcomes.</p> <p>Intensive multimedia communication showed somewhat positive findings for behaviour change outcomes.</p> <p>Audio/visual communication showed somewhat positive findings for improving cognitive risk perception, cognitions about behaviours, and behavioural intention outcomes, with mixed results for behaviour change outcomes.</p> <p>Tailored interventions were more consistently related to behavioural changes (vs. non-tailored interventions).</p> <p>Interventions to reduce risk from HIV/AIDS consistently improved cognitive risk perceptions, cognitions about behaviours, behavioural intentions and behaviours to reduce risk; influenza interventions only showed improved cognitions about behaviours. Findings related to other viruses are few in number and hard to interpret.</p>	Moderate	Very low-Low

<p>Olawepo, J. O., Pharr, J. R., &amp; Kachen, A. (2018). <a href="#"><u>The Use of Social Marketing Campaigns to Increase HIV Testing Uptake: A Systematic Review.</u></a> <i>AIDS Care</i>, 31(2), 153-162.</p>	<p>Oct 10, 2018 Articles were included up to Oct 18, 2017. (Search date not specified)</p>	<p>13 included studies:  <ul style="list-style-type: none"> <li>• 6 cross-sectional</li> <li>• 3 observational cohort</li> <li>• 2 laboratory/surveillance</li> <li>• 1 randomized controlled trial</li> <li>• 1 quasi-experimental</li> </ul> <p>Studies assessed the effect of social marketing campaigns on HIV testing uptake.</p> </p>	<p>Studies reported positive (38%), mixed (38%) and no effect (31%) of social marketing campaigns on HIV testing uptake. Neither campaign design, location, use of theory, population, duration, channels used, or sample size demonstrated an effect on testing outcomes.</p> <p>Limitations of this review include weak study designs of included studies and lack of meta-analysis of the included studies due to differences in reporting metrics. Standardized methodology for reporting exposure to and impact of social marketing campaigns is needed.</p>	<p>Low</p>	<p>Not reported</p>
<p>Schiavo R., May Leung M., &amp; Brown M. (2014). <a href="#"><u>Communicating Risk and Promoting Disease Mitigation Measures in Epidemics and Emerging Disease Settings.</u></a> <i>Pathogens and Global Health</i>, 108(2), 76-94.</p>	<p>Mar 21, 2014 (search completed Jul 2013)</p>	<p>29 included studies; description of included studies not provided.</p>	<p>Specific to low and middle-income countries, interventions to communicate risk and promote disease control at the community, healthcare or multi-sectoral levels may be most effective when using community-based or participatory approaches.</p> <p>There is a gap in research related to how interventions influence policy adoption, social determinants of health, or cost-effectiveness.</p>	<p>Low</p>	<p>Moderate-Low to High</p>
<p>Akl, E. A., Oxman, A. D., Herrin, J., Vist, G. E., Terrenato, I., Sperati, F., ... Schünemann, H. (2011). <a href="#"><u>Using Alternative Statistical Formats for Presenting Risks and Risk Reductions.</u></a> <i>Cochrane Database of Systematic Reviews</i>.</p>	<p>Mar 16, 2011 (search completed Oct 2007)</p>	<p>35 included controlled trials with 41 total comparisons:  <ul style="list-style-type: none"> <li>• 30 randomized</li> <li>• 4 not randomized</li> <li>• 7 unclear</li> </ul> </p>	<p>When presenting statistics on risk, frequencies (e.g., 1 in 100) are better understood than percentages (e.g., 1%) (Standard Mean Difference (SMD)=0.69, 95% CI=0.45-0.93) by health professionals and consumers.</p> <p>For risk reductions, relative risk reduction was perceived as larger and was more likely to be persuasive than absolute risk reduction (SMD=0.66, 95% CI=0.51-0.81) and number needed to treat (SMD=0.65, 95% CI=0.51-0.80).</p>	<p>High</p>	<p>Moderate, by GRADE</p>

Brewer, L. C., Asiedu, G. B., Jones, C., Richard, M., Erickson, J., Weis, J., ... Doubeni, C. A. (2020). <a href="#"><u>Emergency Preparedness and Risk Communication Among African American Churches: Leveraging a Community-based Participatory Research Partnership COVID-19 Initiative.</u></a> <i>Preventing Chronic Disease</i> , 17, E158.	Dec 10, 2020	Quasi-experimental	n=120 African American churches (number of congregation members not provided)	United States	<p>This study describes the reach and engagement, feasibility, and acceptability of a COVID-19 emergency preparedness strategy using culturally relevant materials and community contacts within African American churches. Uptake of preventive measures was not studied.</p> <p>COVID-19 risks were communicated using message maps, containing 4 content areas: 1) inspirational messaging to promote spiritual, physical, and mental wellness; 2) COVID-19 health and preventive measures; 3) financial and community-based support resources; and 4) social support connections. Messages were disseminated via Zoom, Facebook Live, email, and social media channels.</p> <p>Results are described narratively:</p> <ul style="list-style-type: none"> <li>• Reach and engagement of Facebook posts increased over the course of the intervention.</li> <li>• The intervention was considered feasible.</li> <li>• Acceptability of the intervention overall was positive.</li> </ul>	Moderate
---	--------------	--------------------	---	---------------	---	----------

<p>Okuhara, T., Okada, H., &amp; Kiuchi, T. (2020). <a href="#"><u>Examining Persuasive Message Type to Encourage Staying at Home During the COVID-19 Pandemic and Social Lockdown: A Randomized Controlled Study in Japan</u></a>. <i>Patient Education and Counseling</i>. Epub ahead of print.</p>	<p>Aug 21, 2020</p>	<p>Randomized controlled trial</p>	<p>n=1980 adults aged 18-69</p>	<p>Japan</p>	<p>Participants were randomized to receive persuasive messaging, from different narrators (e.g., local political leader, public health expert, physician, patient, resident or control). Intentions to stay home during lockdown, perceived severity, vulnerability, response efficacy, self-efficacy were measured.</p> <p>Messages delivered by a physician significantly increased intention to stay home in areas with high numbers of infections (mean change=0.34; 95% CI=0.26, 0.41), vs. political leader, mean change=0.17; 95% CI=0.11, 0.22); vs. expert, mean change=0.19; 95% CI=0.13, 0.25); vs. resident, mean change=0.17; 95% CI=0.12, 0.23).</p> <p>Messages delivered by a physician also increased perceived severity of the pandemic (mean change=0.23; 95% CI=0.14–0.32), vs. political leader, mean change=0.06; 95% CI=0, 0.12, response efficacy (mean change=0.37; 95% CI=0.29, 0.46) (vs. resident, mean change=0.19; C.I. 0.12, 0.26), and self-efficacy (mean change=0.33; 95% CI= 0.25, 0.41) vs. political leader, mean change=0.17; 95% CI=0.11, 0.23); vs. patient, mean change=0.16, 95% CI=0.09, 0.23).</p>	<p>High</p>
---	---------------------	------------------------------------	---------------------------------	--------------	--	-------------

<p>Moreno, Á., Fuentes-Lara, C., &amp; Navarro, C. (2020). <a href="#">COVID-19 Communication Management in Spain: Exploring the Effect of Information-Seeking Behavior and Message Reception in Public's Evaluation</a>. <i>El profesional de la información</i>, 29(4), e290402.</p>	<p>Jul 2, 2020</p>	<p>Cross-sectional</p>	<p>n=546</p>	<p>Spain</p>	<p>A survey was conducted from Mar 14-Apr 14, 2020 to assess how information forms and sources influence public information-seeking behaviours and perception of the government's crisis response strategies during the pandemic.</p> <p>Mainstream media use (television, newspapers and radio) was reported as high, with users of these platforms expressing more positive opinions of the government's crisis response. People who were mainly informed through Twitter (50.7%) and Facebook (49.5%) strongly believed that the government's communication confused the population, compared to those who used print newspapers (45.4%), online newspapers (46.7%), television (45.9%) and radio (43.8%).</p> <p>Results showed that people rely on different information channels during crisis situations with high simultaneous and multiplatform consumption of information. Television (86.2%), WhatsApp (77.6%), online newspapers (75%), and radio (42.6%) were the most frequently used information channels.</p> <p>Use of multiple and simultaneous platforms may contribute to over-information and contra-information. The inability of some users to discern unreliable messaging must be considered in planning. Factors related to media choice, including use of social media platforms, need to be understood for risk and crisis communication strategies and for further research.</p>	<p>Moderate</p>
