Executive Summary

Background

Health promotion is an essential component of effective public health practice. Health promotion involves implementing wide-reaching social and environmental interventions aimed at enabling individuals to increase control over – and improve – their health (Government of Canada, 2017; World Health Organization, 2023). These interventions have a spectrum of targets, from upstream interventions that act on economic, legal, and political structures to remove barriers and improve support, to downstream efforts focused on individual behaviour change.

While health promotion efforts are commonly incorporated into day-to-day public health practice, their implementation as part of health emergency preparedness and response is equally important (World Health Organization, 2022). Applying a health promotion lens may be particularly important to improving health and wellness outcomes, reducing health inequities, and fostering community resilience. This rapid scoping review, produced to support evidence-informed decision-making in public health, focuses on understanding how upstream and midstream approaches to health promotion have been applied in pandemic and emergency preparedness and response, including building healthy public policies, creating supportive environments, and strengthening community action.

This rapid scoping review includes evidence available up to January 25, 2023, to answer the question: **What is known about the application of upstream and midstream health promotion approaches in the context of H1N1, COVID-19, and mpox (formerly monkeypox) pandemic preparedness and response?**

It also includes evidence to address a secondary question: **What indicators of effectiveness have been reported that may identify promising upstream and midstream health promotion approaches?**

Key Points

- A wide variety of upstream and midstream health promotion approaches were included in this review (n = 23). Most focused on pandemic response efforts related to the COVID-19 pandemic (n=22), and one involved H1N1; none of the approaches identified addressed pandemic preparedness or were related to mpox.
- Most interventions included in this review (n=12) addressed secondary impacts of the pandemic and pandemic restrictions, such as agricultural and food support, social protection, employment, and mental health policies. Food access and food security were described most often, including the provision of food and/or food vouchers to those at risk for food insecurity. Federal legislation, financial support, regulatory flexibility (e.g., extended loan repayment deadlines and insurance enrolment periods), and international and private-public coordination within the agricultural sector were described to protect food supply chains. Emergency income assistance, eviction policies, wage subsidies, and unemployment benefits were reported to mitigate the impact of job loss due to the pandemic. Components of national acts that supported specific populations, such as older adults, people with disabilities, and people experiencing addiction or mental

health issues, were also described, such as reducing the maximum number of take-home drug overdose kits.

- Direct pandemic response approaches (n=13) included those to reduce the risk of transmission (n=3) and increase equitable access to testing (n=6) and vaccination (n=4).
 - Providing emergency sick leave, expanding telehealth use, and opportunities for isolation or physical distancing in congregate settings (e.g., homeless shelters) were described as key policies to reduce transmission risk.
 - Community partnerships were often leveraged to increase local access to testing, and mobile testing sites and drive-through high-volume testing centers were initiated to reduce barriers to testing.
 - Populations experiencing inequities in COVID-19 rates were prioritized in vaccination roll-out, although this was not always realized in local delivery.
- Populations targeted by upstream health promotion interventions in pandemic response included many vulnerable groups (e.g., priority populations for vaccinations, people experiencing homelessness, older adults, people with mental and substance use disorders) and rural, Indigenous, or underserved communities.
- Few indicators of the effectiveness of health promotion approaches were reported in the included studies. Most indicators were simple counts of intervention reach (e.g., how many tests/vaccines were administered, etc.) (n=10) and did not address more complex outcomes (e.g., how interventions were delivered, whether equity goals were realized, etc.). Two studies reported on feasibility.

Overview of Evidence and Knowledge Gaps

- The interventions included in this review were implemented predominately at national/federal (n=10) or local/regional/municipal (n=11) levels of government, followed by provincial/territorial/state levels (n=5). Upstream “building healthy public policy” (n=15) was the component of health promotion prioritized most often, followed by more midstream “strengthening community action” (n=7) and “creating supportive environments” (n=3) components.
- Public health was involved in more of a supporting role for most interventions included in this review (n=21), as these interventions were either driven by other departments (e.g., departments of finance, agriculture, health, etc.) through legislation (e.g., the Families First Coronavirus Response Act and Coronavirus Aid, Relief, and Economic Security (CARES) Act, passed in the United States to address deficiencies in healthcare financing) or led by other partners in multisectoral collaboratives (e.g., community-academic-led testing initiatives). Public health had more of a lead role (n=4) in interventions aimed at increasing equitable access to vaccination.
- The interventions included in this review addressed the following equity dimensions, as framed by [PROGRESS-Plus](#): socioeconomic status (n=17); place of residence (n=12); race, ethnicity, culture, and language (n=4); occupation (n=3); gender/sex (n=1); and “plus” (n=6; e.g., personal characteristics associated with discrimination, such as age and disability). Dimensions of religion, education, and social capital were not addressed.
- Several major federal-level policy reforms, mainly reported in the United States, were enacted to address deficiencies in healthcare financing and improve health and quality of life and were included under more than one category of direct or secondary pandemic

response and health promotion goals. These included Acts and provisions to cover the cost of testing, expand telehealth services, ensure paid sick leave, etc.

- Health promotion approaches targeting food insecurity focused on agricultural production, the functioning of the food chain, and responses to consumer demand were frequently reported. National/federal level interventions included financial support for the sector and production subsidies; at local/regional levels, community programs were established to deliver food boxes for those deemed food insecure.
- Several interventions addressed access to COVID-19 testing and vaccination, where common components included conveniently located and easy-to-access sites, equitable allocation strategies, and community engagement. The indicators of effectiveness for these interventions included vaccine coverage (n=3) and the number of tests performed (n=5). Two studies indicated that the approaches described were feasible to deliver and scale.
- Indicators of effectiveness were generally not reported for interventions to reduce the risk of transmission or interventions to mitigate secondary impacts. One study reported the number of individuals who participated in various quarantine programs, and one reported the number of food boxes delivered.
- A limitation of this rapid scoping review was that an exhaustive jurisdictional scan to confirm and augment published interventions was not conducted. In addition, the policies and programs described here were active at the time of individual articles' publication; many policies may have been temporary and been terminated or evolved.

**Note: total numbers may add to more than the number of included studies, as some interventions addressed more than one category.*

Methods

A description of the development of the National Collaborating Centre for Methods and Tools' Rapid Evidence Service, including an overview of the rapid review process and rationale for methodological decisions, has been published (Neil-Sztramko *et al.*, 2021). Rapid scoping reviews are used to map the concepts underpinning a research area and the main sources and types of evidence available. Scoping review methodology, as described by Arksey and O'Malley, was also used to guide this rapid scoping review (Arksey & O'Malley, 2005).

Research Question

What is known about the application of upstream and midstream health promotion approaches in the context of H1N1, COVID-19, and mpox pandemic preparedness and response?

Secondary Question

What indicators of effectiveness have been reported that may identify promising upstream and midstream health promotion approaches?

Search

On January 25, 2023, the following databases were searched using key terms: "policy", "prepare", "national", "local", "regional", "government", "community", "engage", "decision", "COVID-19", "pandemic", "monkeypox", "mpox", "MPV", "swine flu".

- [MEDLINE](#) database
- [EMBASE](#) database
- [Ovid Emcare](#)
- [Global Health](#)
- [Political Science Database](#)
- [PAIS Index](#)
- [Trip Medical Database](#)

The NCCMT also issued a call to Senior Decision Makers across Canada to share relevant published or unpublished reports, research, or policy publications on the application of upstream and midstream health promotion in the context of COVID-19, H1N1, or mpox.

A copy of the full search strategy is available in [Appendix 1](#).

Study Selection Criteria

English-language, peer-reviewed sources and sources published ahead of print before peer review were eligible for inclusion. Sources reporting surveillance of disease prevalence, opinions or editorials, and modelling studies were excluded.

	Inclusion Criteria	Exclusion Criteria
Population	Government and/or public health systems at local/regional/municipal, provincial/territorial/state, or national levels	Tertiary healthcare systems
Concept	Health promotion (upstream and midstream approaches)*; pandemic preparedness and response	Downstream health promotion approaches (focused on changing individual knowledge or behaviours, e.g., communication campaigns or education initiatives, individual-level interventions)
Context	H1N1, COVID-19, mpox pandemics	Non-pandemic infectious diseases; other pandemics / outbreaks; climate change; natural disasters; and extreme weather; and other public health issues (e.g., opioid crisis)
Setting	OECD member countries	Non-OECD member countries
Design	Primary studies; review articles; governmental reports; research or policy publications from national (e.g., CPHA) or international (e.g., WHO, IANPHI, PAHO) health organizations	Editorials; opinion pieces published outside journals (e.g., mass media, websites like “the conversation”, etc.); modelling studies
Languages	English and French	

*Upstream health promotion approaches target social, structural, and ecological determinants of health; midstream approaches target living conditions and ecosystems (e.g., physical and built, social, economic and work, and service environments) (Public Health Agency of Canada, 2021; Public Health Agency of Canada 2022). Interventions within these approaches may include, but are not limited to:

- Poverty and income inequity reducing policies;
- Decolonizing and anti-racism policies;
- Treaty rights, self-determination, and self-governance for Indigenous Peoples;
- Housing, land and water use, and transportation policies;
- Culturally safe health and social services; and
- Affordable and high-quality childcare.

Screening

Title/abstract screening was facilitated by using Artificial Intelligence (AI) on the DistillerSR reference screening platform. Records were screened in duplicate by two reviewers using a reranking function that reprioritizes relevant references to appear at the top of the screening list. After manually screening approximately half of all records, an AI screening function integrated within DistillerSR was used to determine the probability of the remaining unscreened studies being included through manual review. AI screening was then used as an additional screener to exclude studies with the lowest probability of being included. All studies screened by AI were verified by manual review. In case of discrepancies between manual and AI review, a third reviewer acted as arbitrator.

Data Extraction and Synthesis

Data relevant to the research question, such as study design, country, context, level of intervention (i.e., at what level of government was the intervention implemented), target population, health promotion priority, level of effect, equity, intervention details, and indicators of effectiveness were extracted, when reported. We summarized the results narratively to provide an overview of trends in the included literature.

The quality of included studies was not assessed, as this scoping review reports on what has been described in the literature and does not report study findings.

Citizen Engagement in the Review Process

As part of the NCCMT's call to Senior Decision Makers for relevant published or unpublished reports, research, or policy publications, one Senior Decision Maker was further engaged as a professional partner to provide perspectives that were not captured by the research literature included in this rapid scoping review.

Findings

Summary of Evidence

A total of 23 sources were identified in this rapid scoping review. The findings from across these studies are organized by health promotion aim: reducing risk of exposure or transmission, increasing equitable access to testing, increasing equitable access to vaccination, and mitigating secondary impacts of the pandemic and/or pandemic response measures. One report targeted more than one health promotion aim.

Research Question	Evidence included	
What is known about the application of upstream and midstream health promotion approaches in the context of H1N1, COVID-19, and mpox pandemic preparedness and response?	Synthesis	1
	Single studies	14
	Policy analyses	8
What indicators of effectiveness have been reported that may identify promising upstream and midstream health promotion approaches?	Single studies	8
