## Résumé

### Contexte

Maintenant que la pandémie de maladie à coronavirus 2019 (COVID-19) entre dans sa quatrième année, les restrictions ont été assouplies ou entièrement levées, et la plupart des régions sont revenues à leurs niveaux d'activité d'avant la pandémie. La pandémie de COVID-19 est une occasion de faire le point sur ce qui a fonctionné et ce qui n'a pas fonctionné, en matière de communication avec le public pendant une crise mondiale de maladies transmissibles. Une communication efficace de la part des fonctionnaires, des médecins, des organisations locales de santé publique et des autres chefs de file des communautés est nécessaire pour aider le public à prendre les décisions qui les protégeront le mieux, eux et leur entourage.

Cette revue rapide a été produite pour soutenir la réponse de l'Agence de la santé publique du Canada à la pandémie de coronavirus 2019 (COVID-19) ainsi que pour éclairer les stratégies de communication dans l'éventualité de futures crises de santé publique. Cette revue vise à recenser, évaluer et résumer les nouvelles données de recherche à l'appui de la prise de décision fondée sur des données probantes.

Cette revue se fonde sur les données probantes issues de la recherche les plus récentes auxquelles il était possible d'avoir accès au moment de sa publication. Une version précédente a été terminée le 12 février 2021. Cette version mise à jour inclut les données probantes disponibles au 16 novembre 2022, nous répondons à la question suivante : **Quelles sont les meilleures pratiques en matière de communication des risques et de stratégies visant à réduire les comportements à risques?**

### Qu'est-ce qui a changé dans cette version?

- De nouvelles données probantes spécifiques à la COVID-19 sont apparues et sont incluses dans cette mise à jour. Plus précisément, dix nouvelles synthèses, trente-huit nouvelles études uniques, une étude unique en cours de réalisation et un protocole de revue ont été trouvés. Pour cette raison, 11 revues non liées à la COVID ont été retirées de cette version. [Une version archivée de la version 1](#) peut être consultée ici, et une liste des études précédemment incluses, mais maintenant exclues, peut être consultée à [l'Annexe 2](#).
- Ces nouvelles études offrent davantage de précisions quant aux caractéristiques des porte-parole efficaces, comme des médecins pour certaines populations.
- Un très petit nombre d'études se penchent sur la désinformation et proposent des manières de la combattre. Pour en savoir plus sur la désinformation, veuillez consulter notre [revue rapide explorant les expériences du public en matière d'accès et d'interaction avec les informations de santé publique pendant la pandémie de COVID-19](#).
- Des données probantes continuent d'apparaître au sujet du cadrage des messages.
- De nouvelles données probantes sont apparues au sujet des éléments dont il faut tenir compte dans l'utilisation de la communication visuelle des risques. Celles-ci contiennent des recommandations sur l'utilisation de la visualisation des données, des couleurs et d'aides visuelles positives pour éviter la mauvaise interprétation des informations de santé publique.
- Tous les autres points clés demeurent en accord avec la version précédente.

## Points clés

- La littérature portant sur la communication des risques relativement à la COVID-19 souligne l'importance de messages clairs, répétés et axés sur l'action, provenant d'un ou d'une leader de confiance (p. ex. médecin, leader de la communauté, professionnel de la santé publique crédible). Le degré de certitude de ces données probantes est modéré (GRADE) et les conclusions sont peu susceptibles de changer à mesure que de nouvelles données apparaîtront.
- Les principes de la communication des risques n'ont pas changé, bien que certains aspects additionnels de la communication soient devenus plus pertinents, y compris l'importance de communiquer rapidement, de communiquer l'incertitude, d'aborder les mythes, de prioriser la cohérence des messages de communication des risques et d'utiliser un langage simple. Le degré de certitude de ces données probantes est modéré (GRADE) et les conclusions sont peu susceptibles de changer à mesure que de nouvelles données apparaîtront.
- On a observé que la consommation des médias traditionnels (p. ex., les journaux, les nouvelles télévisées, la radio) entraîne une meilleure rétention des messages ainsi que l'expression d'opinions plus favorables à la gestion de la crise par les gouvernements. La communication sur la santé entre les pairs et les interventions multimédias intensives ont démontré leur efficacité pour influencer l'adoption de comportements de prévention des maladies liées à des virus. Le degré de certitude de ces données probantes est modéré (GRADE) et les conclusions sont peu susceptibles de changer à mesure que de nouvelles données apparaîtront.
- D'autres données probantes récentes portent à croire que les caractéristiques suivantes sont efficaces pour sensibiliser le public et influencer les attitudes et les comportements : les messages positifs d'empathie qui mettent en relief un message de responsabilité collective ou sociale, à l'opposé d'une approche individuelle; et les messages qui expriment l'espoir plutôt que la peur, les succès liés à la COVID-19 et le réconfort, l'utilisation de multiples canaux de communication, les messages culturellement pertinents, le recours à l'écoute sans jugement, et la réponse aux rumeurs et aux conspirations. Le degré de certitude de ces données probantes est modéré (GRADE) et les conclusions sont peu susceptibles de changer à mesure que de nouvelles données apparaîtront.
- Les partenariats locaux et communautaires sont essentiels, d'abord pour instaurer la confiance, mais aussi pour comprendre les besoins communicationnels d'une communauté, les moyens de communication efficaces (médias sociaux ou face à face), ainsi que les façons les plus efficaces de cadrer et de personnaliser les messages. Le degré de certitude de ces données probantes est modéré (GRADE) et les conclusions sont peu susceptibles de changer à mesure que de nouvelles données apparaîtront.
- Tant le message que le canal de communication devraient être adaptés aux publics cibles. L'implication des parties prenantes est importante pour trouver le cadrage, le thème et le canal les plus appropriés au message. Le degré de certitude des données probantes est faible (GRADE) et les conclusions pourraient changer à mesure que de nouvelles données apparaîtront.
- La communication visuelle des risques peut être utile, mais elle peut aussi être problématique. Si les codes de couleur peuvent exercer une influence, ils sont parfois trompeurs. La visualisation des risques sur une échelle n'est pas toujours perçue

comme étant fiable, selon le type d'échelle utilisé. Parmi les conseils concernant la communication visuelle des risques, mentionnons des aides visuelles positives et la présentation de données sur une échelle linéaire. Le degré de certitude des données probantes est faible (GRADE) et les conclusions pourraient changer à mesure que de nouvelles données apparaîtront.

- En ce qui concerne l'expression du risque à l'aide de statistiques, les fréquences sont mieux comprises que les pourcentages, et le risque relatif est plus persuasif que le risque absolu ou que le nombre de personnes à traiter. Le degré de certitude des données probantes est faible (GRADE) et les conclusions pourraient changer à mesure que de nouvelles données apparaîtront.
- On peut renforcer la confiance accordée au message et à la personne qui le livre en abordant les incertitudes économiques, sociales et liées au virus, ainsi qu'en reconnaissant que les recommandations ou les informations peuvent avoir changé et que des erreurs peuvent avoir précédemment été commises. Le degré de certitude des données probantes est faible (GRADE) et les conclusions pourraient changer à mesure que de nouvelles données apparaîtront.
- Dans l'ensemble, les médias sociaux semblent sous-utilisés comme moyens de diffuser des messages personnalisés (c.-à-d. sur le plan du langage, de la concordance raciale, de l'identité sociale), de communiquer les risques efficacement en utilisant tous les objectifs de la communication des risques, et de réfuter les mythes et la désinformation. Le degré de certitude des données probantes est faible (GRADE) et les conclusions pourraient changer à mesure que de nouvelles données apparaîtront.
- Les données probantes sont insuffisantes au sujet de l'expérience des inégalités sociales et structurelles vécues par plusieurs populations, comme les communautés autochtones ou racialisées. Bien qu'une grande quantité de nouvelles données probantes soient apparues depuis la dernière mise à jour de cette revue (février 2021), il reste des lacunes dans la recherche concernant la communication des risques auprès de populations en quête d'équité. Des mécanismes sont nécessaires pour veiller à ce que des études soient réalisées de manière à ce que les expériences des groupes en quête d'équité soient rapportées et représentées adéquatement.
- La majorité des études contenues dans cette revue ne déclarent pas leurs sources de financement ou n'ont pas reçu de financement pour leur recherche. Parmi les études qui déclarent leurs sources de financement, la plupart sont financées par des établissements nationaux ou des universités. Les bailleurs de fonds sont encouragés à affecter des ressources pour approfondir les connaissances au sujet de la communication des risques auprès de populations prioritaires.

## Aperçu des données probantes et lacunes dans les connaissances

- On observe que les médecins sont des porte-parole efficaces pour transmettre les connaissances relatives à la COVID-19 auprès de certains segments de la population, dont les publics japonais, noirs et latino-américains. De plus, le fait que des médecins soient de la même race/ethnicité que leur public est particulièrement efficace pour améliorer les connaissances des publics noirs. D'autres efforts de personnalisation (p. ex., reconnaître l'injustice et les difficultés économiques, ou répondre à la peur que le port du masque suscite de l'ostracisme ou du racisme) n'ont pas eu d'effets significatifs sur les connaissances ou sur les comportements de prévention.

- D'autres études sont nécessaires au sujet des autres caractéristiques d'un leader de confiance et des intermédiaires de la communauté, ainsi que pour comprendre qui est la meilleure personne pour offrir des communications à des publics cibles précis.
- Pour élaborer des stratégies de communication des risques dans des pays à faible et à moyen revenu, l'engagement et la participation de la communauté donnent les meilleurs résultats.
- La communication efficace au sujet des vaccins dépend de plusieurs facteurs, y compris la perception du risque du virus et des effets secondaires des vaccins, le niveau de connaissances (p. ex., le fonctionnement des vaccins), et les rares études qui s'intéressent à la communication au sujet des vaccins contre la COVID-19 s'alignent sur les approches générales de communication des risques au sujet de la COVID-19.
- On ignore les mécanismes des médias sociaux qui sont les plus efficaces (c.-à-d. mots-clés, texte sur des vidéos et des images, graphiques), ou quelles plateformes entraînent les plus importants changements de comportements. Cependant, il est important de comprendre le rôle des médias sociaux pour offrir des messages personnalisés et combattre la désinformation auprès de populations précises.
- Quelques études se sont penchées sur la transformation de la communication des risques au début de la pandémie de COVID-19, mais il faut plus d'études rétrospectives qui examinent quels objectifs de la communication des risques ont été soulignés au cours des diverses phases de la pandémie. Bien que les données probantes au sujet de la communication des risques sur la COVID-19 continuent de croître, ce que nous savons se limite généralement aux premières phases de la pandémie. Seul un petit nombre d'études ont recueilli des données en 2021 ( $n=4$ ), et aucune des études incluses dans cette revue n'a recueilli de données en 2022.

## Méthodologie

### Question de recherche :

Quelles sont les meilleures pratiques en matière de communication des risques et de stratégies visant à réduire les comportements à risques?

### Recherche

Les bases de données suivantes ont été fouillées les 16 novembre 2022 en utilisant les termes clés : "risk communication", "behavioural science", "behavioral science", "social marketing", "social behaviour", "social behavior", "persuasive communication", "health communication". Cette recherche s'appuie sur la recherche précédente réalisée dans la première version de cette revue rapide.

- [MEDLINE database](#)
- [EMBASE database](#)
- [PsycINFO](#)
- [Cochrane Library](#)
- [ERIC](#)
- [Trip Medical Database](#)
- World Health Organization's [Global literature on coronavirus disease](#)
- [COVID-19 Evidence Alerts](#) from McMaster PLUS™

## Critères de sélection des études

Les sources de langue anglaise et français évaluées par les pairs et les sources publiées avant l'impression et avant l'évaluation par les pairs ont également été incluses. Lorsqu'il y en a, les résultats des synthèses sont présentés en premier. En effet, ceux-ci tiennent compte de l'ensemble des données probantes dont on dispose et peuvent donc être appliqués de façon large aux populations et aux contextes.

D'autres critères d'exclusion ont été établis afin d'affiner l'objectif de cette revue, étant donné la grande quantité de données probantes et l'évolution de la pandémie de COVID19. À compter de la présente version (janvier 2023), les études qui ne s'attardent pas à la communication des risques au sujet de la COVID-19 ont été exclues.

Une liste complète des études ayant précédemment été incluses, mais maintenant exclues, peut être consultée à [l'Annexe 2](#).

Les études uniques ont été incluses si aucune synthèse n'était disponible ou si des études uniques ont été publiées après que la recherche ait été effectuée à partir de la synthèse. Les documents d'orientation spécifiques à la communication des risques durant la pandémie de COVID-19 et issus d'organisations de santé publique nationales et internationales ont été considérés comme pertinents et inclus. Les sources de surveillance ont été exclues.

	Critères d'inclusion	Critères d'exclusion
Population	La population en général	
Intervention	Communication des risques, en santé publique et dans d'autres contextes	Prise de décision clinique, aide à la décision clinique
Comparaison	-	
Résultats	Modification des connaissances, des attitudes et des comportements	

## Extraction et synthèse des données

Pour les synthèses, les données sur la conception de l'étude, le cadre, l'emplacement, les caractéristiques de la population, les interventions ou l'exposition et les résultats ont été extraites au moment de la déclaration. Pour les documents d'orientation, les données sur l'administration, l'organisation, la date de publication et la nature de l'orientation ont été extraites au moment de la déclaration

## Évaluation de la qualité des données probantes

Nous avons évalué la qualité des données probantes incluses en utilisant des outils d'évaluation critique, comme nous le décrivons ci-dessous. L'évaluation de la qualité a été réalisée par un examinateur et vérifiée par un deuxième examinateur. Les conflits ont été résolus par la discussion.

Méthodologie de l'étude	Outils d'évaluation critique
Synthèse	Assessing the Methodological Quality of Systematic Reviews (AMSTAR) <a href="#">AMSTAR 1 Tool</a>
Transversale	Joanna Briggs Institute (JBI) <a href="#">Checklist for Analytical Cross-Sectional Studies</a>
Méthodes mixtes	Mixed Methods Appraisal Tool (MMAT) <a href="#">MMAT Tool</a>
Qualitative	Joanna Briggs Institute (JBI) <a href="#">Checklist for Qualitative Research</a>
Quasi expérimentale	Joanna Briggs Institute (JBI) <a href="#">Checklist for Quasi-Experimental Studies</a>
Essai clinique randomisé	Joanna Briggs Institute (JBI) <a href="#">Checklist for Randomized Controlled Trials</a>

Les évaluations de la qualité effectuées pour chaque étude incluse sont disponibles sur demande.

L'approche GRADE (Grading of Recommendations, Assessment, Development and Evaluations) a été utilisée pour évaluer la certitude des résultats sur la base de huit domaines clés.

Selon l'approche GRADE en matière de qualité des données probantes, les études observationnelles, telles que celles incluses dans cette revue, fournissent des données probantes de faible qualité. Cette évaluation peut être réduite encore davantage en fonction d'autres domaines :

- un risque de biais élevé;
- l'incohérence des effets;
- le caractère indirect des interventions/résultats;
- des imprécisions dans l'estimation de l'effet;
- un biais de publication.

À l'inverse, elle peut être rehaussée sur la base des domaines suivants :

- un effet important;
- une relation dose-effet;
- une prise en compte des variables confusionnelles.

Pour chaque résultat, la certitude globale des données probantes a été déterminée en tenant compte des caractéristiques des données probantes dont on dispose (des études observationnelles, dont certaines n'ont pas été évaluées par les pairs, des variables confusionnelles potentielles qui n'ont pas été prises en compte, des essais et des protocoles d'essais différents, et une absence de groupes de comparaison valides). Un jugement selon lequel « la certitude globale est très faible » signifie que les résultats risquent fort de changer à mesure que de nouvelles données probantes apparaissent.

# Résultats

## Synthèse de la qualité des données probantes

Dans cette version, 10 nouvelles synthèses, 38 nouvelles études uniques, une étude unique en cours de réalisation et un protocole de revue ont été trouvés, pour un total de 63 publications.

Quelles sont les meilleures pratiques en matière de communication des risques et de stratégies visant à réduire les comportements à risques?

Résultats	Données probantes incluses		Certitude globale des données probantes (GRADE)
	Méthodologie de l'étude	n	
Les messages devraient être clairs, répétés, axés sur l'action et offerts par un ou une leader de confiance (p. ex., médecin, chef de file de la communauté, professionnel de la santé publique de confiance).	Synthèses	6	⊕⊕⊕○ Modérée <sup>1</sup>

Grimani, A., Bonell, C., Michie, S., Antonopoulou, V., Kelly, M.P., & Vlaev, I. (2021). <a href="#">Effect of prosocial public health messages for population behaviour change in relation to respiratory infections: A systematic review protocol</a> . <i>BMJ Open</i> , 11(1), e044763.	Not reported	The review aims to synthesize the literature on infectious diseases communication strategies for population behaviour change and specifically focus on "protecting each other." The review will answer the following questions: (a) are "other" focused messages effective? (b) what behaviour(s) do messages about protecting others have a positive effect on? and (c) what populations do these "protecting other" messages have a positive effect on?

<b>New evidence reported November 16, 2022</b>						
Lowe, M., Harmon, S.H.E., Kholina, K., Parker, R., & Graham, J.E. (2022). <a href="#">Public health communication in Canada during the COVID-19 pandemic</a> . <i>Canadian journal of public health</i> , 113(Suppl 1), 34–45.	Nov 3, 2022	Mixed methods	n=34 key informant interviews (global, federal, provincial and territorial public health actors)  Other sources of data include: <ul style="list-style-type: none"><li>• 287 news releases</li><li>• 60 provincial public health updates</li></ul>	Alberta Nova Scotia Ontario	From Jan 31, 2020 – Oct 5, 2021, provincial epidemiological data, public health communication (including official provincial updates and news reports) and key informant interviews were triangulated to measure how well each province communicated to the public about the COVID-19 pandemic.  Overall, messaging from each province did not meet the conditions of “good communication” (transparency, promptness, clarity, engagement of diverse communities), which was found to undermine public trust in public health communication.	Moderate
Kompani, K., Deml, M.J., Mahdavian, F., Koval, O., Arora, S., & Broqvist, H. (2022). <a href="#">Who Said What: A Multi-Country Content Analysis of European Health Organisations' COVID-19 Social Media Communication</a> . <i>International journal of public health</i> , 67, 1604973.	Sep 22, 2022	Mixed methods	n=1,633 social media posts from 15 official government health authorities	Germany Norway Sweden Switzerland United Kingdom	From Jan to Dec 2020, Facebook, Instagram and Twitter COVID-19 posts from government health authorities were compared to the CDC's Crisis and Emergency Risk Communication (CERC) model (early, correct, credible information with empathy, communicate concrete actions people can take, and show respect by promoting collaboration and rapport).  Overall, health authorities' social media communication included the majority of the CERC domains. However, there was not sufficient on-going communication with the public during the pre-pandemic phase and after the initial easing of restrictions between waves.  Messaging differed depending on which platform was being used. Instagram tended to be the most underutilized platform yet may have the greatest impact based on audience size and the potential for two-way communication.	Low
